# Selection of the Cutting Conditions Considering Quality of Chip Disposal 

Kazunori NAGASAKA* and Fumio HaShimoto *

(Recieved June 15, 1985)

#### Abstract

The quality of chip disposal which can be given by merit marks of chip forms is estimated considering cutting conditions and work materials. The merit marks are expressed as a mathematical model identified by GMDH (Group Method of Data Handling) algorithm with successive determination of polynomial trends containing interaction terms. The established model can be used as a constraint in determining economically optimum cutting condition, that is, it can be selected under high quality of chip disposal.

## 1. Introduction

The mathematical models expressing quality of chip disposal by means of merit marks of chip forms are identified by basic GMDH ${ }^{1)}$ and GMDH of variable selection type ${ }^{2}$. In those models, merit marks are output variables and chemical compositions and mechanical properties of work materials are input variables under constant cutting conditions. The factors affecting to the chip forms are selected from among the chemical compositions and mechanical properties and then the relationship between each factor and the chip forms is investigated.

This paper describes identification of a mathematical model by GMDH algorithm, considering the factors (cutting speed, feed, depth of cut, nose radius and side cutting edge angle in addition to the characteristics of work materials) and their interactions. Since GMDH algorithm with successive determination of polynomial trends proposed by Ivakhnenko ${ }^{3}$ ) is the way to introduce one variable at each layer, the algorithm cannot be applied to identify the systems containing interactions between input variables. In this paper a new GMDH algorithm with successive determination of trends containing interaction terms is presented. The identified model by the proposed algorithm can be used for one of constraints in determination of economically optimum cutting conditions for a given work material.

## 2. GMDH Algorithm with Successive Determination of Polynomial Trends Containing Interaction Terms

Let us describe the GMDH algorithm that uses the partial descriptions with all inputs taken not only one variable but also two variables at a time to consider interactions among input variables.

Step (1). Choose the input variables considered to affect the output.
Step (2). Separate the data into a training set and a checking set.
The training data are used to estimate the coefficients of the partial descriptions.

[^0]The checking data are used to evaluate the accuracy of the partial descriptions and to prevent overfitting. The following method of separation ${ }^{4}$ ) is used:

Calculate the variance of all variables

$$
\begin{align*}
& D_{i}^{2}=\sum_{j=1}^{P}\left(\frac{x_{i j}-\bar{x}_{j}}{\sigma_{j}}\right)^{2}  \tag{1a}\\
& \sigma_{j}^{2}=\frac{1}{n} \sum_{i=1}^{n}\left(x_{i j}-\bar{x}_{j}\right)^{2} \tag{1b}
\end{align*}
$$

where $p$ is the number of input variables and $n$ is the number of data. Arrange the data points sorted in descending order of magnitude. Roughly $50 \sim 70 \%$ of the data with larger variance are put into a training set, and the rest, $30 \sim 50 \%$ of the data, with smaller variance are put into a checking set.

Step (3). Form the partial descriptions as follows:
(1) The partial descriptions with all inputs taken one variable.

Estimate the coefficients of

$$
\begin{align*}
& y_{i 1}=f_{i 1}\left(x_{i}\right)=a_{01}+a_{11} x_{i}  \tag{2}\\
& y_{i 2}=f_{i 2}\left(x_{i}\right)=a_{02}+a_{12} x_{i}+a_{22} x_{i}^{2} \tag{3}
\end{align*}
$$

The coefficients in eqs. (2) and (3) are estimated by the least squares method using the training data. Calculate the mean square error between each estimated value and the checking data

$$
\begin{equation*}
\Delta_{m}^{2}=\frac{1}{n_{c h}} \Sigma_{n_{c h}}\left(\hat{y}_{i m}-y_{i}\right)^{2} \quad m=1.2 \tag{4}
\end{equation*}
$$

where $n_{c h}$ is the number of checking data. The $\hat{y}_{i m}$ are then sorted according to these values. Select $m_{\text {opt }}$ that minimizes the mean square error:

$$
\begin{align*}
& \hat{y}_{i}=f_{i}\left(x_{i}\right)=f_{i m \mathrm{opt}}\left(x_{i}\right)  \tag{5}\\
& \Delta_{i}^{2}=\Delta_{i m_{\mathrm{opt}}}^{2} \tag{6}
\end{align*}
$$

Choose $f_{i}\left(x_{i}\right)$ and $\Delta_{i}^{2}$, varying the argument number $i(i=1, \cdots, p)$.
(2) The partial descriptions with all inputs taken two variables at a time. Form the combination with all inputs taken two variables at a time:

$$
\begin{equation*}
C_{k}=\left(x_{i}, x_{j}\right) \tag{7}
\end{equation*}
$$

Estimate the coefficients of

$$
\begin{equation*}
\hat{y}_{k 1}=g_{k 1}\left(x_{i}, x_{j}\right)=b_{01}+b_{11} x_{i}+b_{21} x_{j}+b_{31} x_{i} x_{j} \tag{8}
\end{equation*}
$$

$$
\begin{align*}
& \hat{y}_{k 2}=g_{k 2}\left(x_{i}, x_{j}\right)=b_{02}+b_{12} x_{i}+b_{22} x_{j}+b_{32} x_{i} x_{j}+b_{42} x_{i}^{2}  \tag{9}\\
& \hat{y}_{k 3}=g_{k 3}\left(x_{i}, x_{j}\right)=b_{03}+b_{13} x_{i}+b_{23} x_{j}+b_{33} x_{i} x_{j}+b_{53} x_{j}^{2}  \tag{10}\\
& \hat{y}_{k 4}=g_{k 4}\left(x_{i}, x_{j}\right)=b_{04}+b_{14} x_{i}+b_{24} x_{j}+b_{34} x_{i} x_{j}+b_{44} x_{i}^{2}+b_{54} x_{j}^{2} \tag{11}
\end{align*}
$$

Calculate the mean square error between each estimated value and checking data as

$$
\begin{equation*}
\delta_{m}^{2}=\frac{1}{n_{c h}} \Sigma_{n_{c h}}\left(\hat{y}_{k m}-y_{i}\right)^{2} \quad m=1, \cdots, 4 \tag{12}
\end{equation*}
$$

Select $m_{\text {opt }}$ that minimizes the mean square error:

$$
\begin{align*}
& \hat{y}_{k}=g_{k}\left(x_{i}, x_{j}\right)=g_{k m_{\mathrm{opt}}}\left(x_{i}, x_{j}\right)  \tag{13}\\
& \delta_{k}^{2}=\delta_{k m_{\mathrm{opt}}^{2}} \tag{14}
\end{align*}
$$

Choose $g_{k}\left(x_{i}, x_{j}\right)$ and $\delta_{k}^{2}$, varying the argument number $k(k=1, \cdots, s)$, where $s={ }_{p} C_{2}$.
Step (4). Select the optimum partial descriptions.
As the optimum partial descriptions, select $F$ partial descriptions in ascending order of errors among $\Delta_{i}^{2}(i=1, \cdots, p)$ and $\delta_{k}^{2}(k=1, \cdots, s)$ where $F$ denotes a freedom of choice. To illustrate, let $F=3$ and minimum errors by $\Delta_{1}^{2}, \Delta_{2}^{2}$ and $\delta_{k}^{2}$, as shown in Fig. 1. The partial descriptions for the first layer are as follows:

$$
\begin{align*}
& \hat{y}_{1}=f_{1}\left(x_{1}\right) \\
& \hat{y}_{2}=f_{2}\left(x_{2}\right)  \tag{15}\\
& \hat{y}_{3}=g_{k}\left(x_{i}, x_{j}\right)
\end{align*}
$$

Step (5). The second layer.
In the second layer, the residuals, $z_{1}=y-f_{1}\left(x_{1}\right), z_{2}=y-f_{2}\left(x_{2}\right)$ and $z_{3}=y$ $-g_{k}\left(x_{i}, x_{j}\right)$ become new output variables respectively. Form the partial descriptions using the remaining $p+s-1$ variables with Step (3). The partial descriptions for the second layer are as follows:

$$
\begin{gather*}
\text { group 1 }\left\{\begin{array}{c}
y-f_{1}\left(x_{1}\right)=f_{12}\left(x_{2}\right) \\
y-f_{1}\left(x_{1}\right)=f_{13}\left(x_{3}\right) \\
\vdots \\
\vdots \\
y-f_{1}\left(x_{1}\right)=g_{1 k}\left(x_{i}, x_{j}\right)
\end{array}\right. \\
\text { group 2 }\left\{\begin{array}{c}
y-f_{2}\left(x_{2}\right)=f_{21}\left(x_{1}\right) \\
y-f_{2}\left(x_{2}\right)=f_{23}\left(x_{3}\right) \\
\vdots \\
y-f_{2}\left(x_{2}\right)=g_{2 k}\left(x_{i}, x_{j}\right)
\end{array}\right. \tag{16}
\end{gather*}
$$

$$
\text { group } 3\left\{\begin{array}{c}
y-g_{k}\left(x_{i}, x_{j}\right)=f_{31}\left(x_{1}\right) \\
y-g_{k}\left(x_{i}, x_{j}\right)=f_{32}\left(x_{2}\right) \\
\vdots \\
\vdots \\
y-g_{k}\left(x_{i}, x_{j}\right)=g_{3 s}\left(x_{p-1}, x_{p}\right)
\end{array}\right.
$$

Select the group containing the polynomial that minimizes the error among these $3 \times(p+s-1)$ polynomials. In this layer the most effective variable in the first layer among them is selected. To illustrate, let $\Delta_{24}^{2}$ be the minimum error as shown in Fig. 1. Then the variable to be introduced in the first layer becomes $x_{2}$ and the partial description for the first layer becomes $f_{2}\left(x_{2}\right)$. In the second layer, select $F(F=3)$ partial descriptions in ascending order of errors are selected again, and then those are let through to the third layer, etc.

Fig. 1. Structure of GMDH algorithm $F=3$

Fig. 1. (Continued)

Step (6). Stopping rule.
To illustrate, let the minimum error of the $l$ th layer be $\Delta_{l 1}^{2}$ and $\Delta_{l-1}^{2} \geqslant \Delta_{l 1}^{2}$ as shown in Fig. 1 (Continued). Then the variable to be introduced in the ( $l-1$ )th layer becomes $x_{a}$. Furthermore let the minimum error of the $(l+1)$ th layer be $\delta_{l+1}^{2}$. Then the variables to be introduced in the $l$ th layer are $x_{b}$ and $x_{c}$. If $\Delta_{l-1}^{2}<\Delta_{l 1}^{2}$, then this procedure stops up to the $(l-1)$ th layer. Consequently the obtained complete description is

$$
\begin{equation*}
y=f_{2}\left(x_{2}\right)+g_{2}\left(x_{d}, x_{e}\right)+g_{3}\left(x_{f}, x_{g}\right)+\cdots+f_{l-1}\left(x_{a}\right) \tag{17}
\end{equation*}
$$

## 3. Identification of Chip Form Prediction Model by GMDH

The prediction model for chip forms in turning is identified by GMDH algorithm with successive determination of trends containing interaction terms. In the model the characteristics of work materials in Table 1 and the cutting conditions in Table 2 are input variables, and in which the merit marks for chip forms based on INFOS data sheet in Fig. 2 are output variables. The procedure of the identification is as follows:
(1) Selection of input variables

Cutting speed $V$, feed $f$, depth of cut $d$, nose radius $R$ and side cutting edge angle $C_{s}$ concerned with cutting conditions, and carbon $C$, sulphur $S$, chromium $C_{r}$, elongation $E l$, reduction of area R.A. and Brinell hardness $H_{B}$ concerned with work materials ${ }^{1)}$ are selected as input variables.
(2) Separation of input and output data

The variances of input data are calculated by eq. (1) and the data with larger variances are put into the training set and the rest are put into the checking set. The separation ratios are made changeable so as to obtain the optimum model.
(3) Generation and selection of partial descriptions

By eqs. (2) and (3) for $x_{i}(i=1, \ldots, 9)$ and eqs. (8), (9), (10) and (11) for $C_{k}\left(x_{i}, x_{j}\right)$ $(k=1, \cdots, 55)$, total 64 partial descriptions are generated. The parameters of these descriptions are estimated by the least square method using the training data, and $\Delta^{2}$ in eq. (4) and $\delta^{2}$ in eq. (12) are calculated using the checking data. The five ( $F=5$ ) mean square errors in increasing order are determined and the corresponding five descriptions are selected.

Step (5) is to be repeated on and after the second layer, and the operation is terminated by the stopping rule in Step (6).

As the results of varying the separation ratio $\left(N_{t} / N_{c}\right)$, the introduced variables and the mean square errors at each layer are obtained as shown in Table 3. It is evident from the table that the model corresponding to $N_{t} / N_{c}=25 / 13$ is adopted as the optimum and that variable numbers $2,5,6,7$ and 9 have great effect on the chip forms.

The complete description is expressed as sum of partial descriptions (see Appendix) and the estimate of the merit mark of chip form can be obtained by substituting the data into these descriptions. The contours of the merit marks $P$ are shown in Fig. 3 for a given work material and tool geometry.

Thus the chip forms can be predicted with the model identification using the pro-

## APPENDIX

The partial descriptions and their parameters of the optimum model in section 3 is shown in order of the selection layer as in Table A-1. In the table, for example, the partial description in the first layer is

$$
P=-3.06+29.8 x_{1}+16.4 x_{2}-19.7 x_{1} x_{2}-11.2 x_{1}^{2}-22.4 x_{2}^{2}
$$

The complete description is expressed as sum of all of the partial descriptions.

Table A-1. The input variables and parameters in partial descriptions for each layer

| Layers | $\mathrm{f}\left(x_{i}, x_{j}\right)$ | $x_{0}$ | $x_{i}$ | $x_{j}$ | $x_{i} x_{j}$ | $x_{i q}^{2}$ | $x_{j}^{2}$ |
